

As manufacturer we can offer you the following:

Maintenance kit for cleaning stainless steel bollards, hooks and road studs.

Consists of :

- Stainless steel cleaner
- Scotch brite 1 M
- Cleaning cloth

Stainless steel should be cleaned regularly to maintain good appearance and corrosion resistance. Cleaning is necessary to keep the self-healing mechanism intact and to avoid high concentrations of corrosive compound. Stainless steel surfaces remain intact when cleaned frequently. Rinse regularly with water to remove all dirt.

By using a stainless steel cleaner, the dirt is removed and the surface remains better protected and nourished by the oil.

Cleaning recommendations :

- Work in the polishing direction and not across it.
- Do not use steel wool or hard objects.
- Do not use chlorinated cleaning agents such as bleach or strong acids.
- Apply the cleaner with a cleaning cloth. Do not spray directly on the surface.
- Rub with scotch brite in the polishing direction.
